

Security Assessment Report

Target: <http://www.itsecgames.com/>

Analyst: Alisha Patel

Date: 05/09/2026

Summary

A security assessment on a publicly accessible endpoint, <http://www.itsecgames.com/> was performed using automated public security tools.

Tools Used

The tools used for security assessment are OWASP ZAP for scanning vulnerabilities on the endpoint, SSL Labs Server Test for assessing its SSL configuration and certificate health, and SecurityHeaders for any additional exposed information on the headers.

Findings

Issue	Description	Evidence	Risk	Severity	Recommendation
Invalid and untrusted SSL Certificates	The server used an expired and self signed SSL which is untrusted by the servers.	ssl-certificate ssl-summary	Users can't verify the authenticity of the servers. It can also result in Man-In-The-Middle attacks.	High	Replace with a valid certificate from Certificate Authority.
Weak SSL/TLS Configuration	The server supports outdated protocols like TLS 1.0 and 1.1 and includes weak cipher suites	ssl-protocols-cipher ssl-protocol-details	This makes the endpoint vulnerable to cryptographic attacks and doesn't have enough encryption strength.	High	Disable TLS 1.0 and 1.1. Use TLS 1.2 or 3. Remove weak cipher suites
Missing HTTP Security Headers	It doesn't implement security headers, CSP	header-analysis	This allows for increased risk of XSS attacks. Vulnerability to clickjacking and browser-side	Medium	Add necessary headers: Content-Security-Policy: default-src 'self'; X-Frame-Options:

			protection.		DENY X-Content-Type-Options: nosniff
Information disclosure	The server exposes information such as HTTP response behavior, hostname, etc.	ssl-servier-info	This helps attackers by allowing targeted attacks.	Low	Remove or obfuscate server headers and reduce exposed system details
Missing HTTP Strict Transport Security	The server does not enforce HTTPS via HSTS.	ssl-protocol-details	This makes users vulnerable to downgrade attacks	Medium	Add Strict-Transport-Security: max-age=31536000; includeSubDomains

Prioritization

Finding	Priority	Severity
Invalid SSL	Expedite	High
Weak TLS	Expedite	High
Missing security headers	High	Medium
Information Disclosure	Medium	Low
Missing HSTS	High	Medium

Conclusion

The assessment identified multiple critical vulnerabilities, particularly in cryptographic configuration and HTTP security controls. Immediate attention should be given to SSL certificate validity and TLS protocol hardening. Addressing these issues will significantly improve the system's overall security posture and reduce exposure to common web-based attacks.
